Local machine
Build bundle: train and validation images, code, starting weights, digest (test rows refused)
Owner approval and live price check before renting
Upload: 16 parallel streams, 128 MB chunks, retries, remote SHA-256 check
SSH
Rented GPU instance (Vast.ai)
setup: pinned dependencies, GPU check
data: verify digest, unpack bundle
train: detached run, time cap, watchdog; workers set by RAM
status, files
pack: stripped checkpoints, logs, SHA256SUMS
Download stripped checkpoints during training
Destroy instance; verify billing
select_checkpoint.py (validation lists only), then evaluation scripts
